Certificado de Atividade - IV Semana Nacional da Área da Tecnologia da Informação

Certificado de Participação - IV Semana Nacional da Área da Tecnologia da Informação

Alan Renan Soares Sobral Sena

Software Engineer | Lua Specialist | High-Performance Systems & Scalability | Back-end Optimization | TS · React · Vue
Caruaru, Pernambuco, Brazil

Summary

I'm a Back-end Software Engineer focused on what's "under the hood." My expertise lies in Lua and high-concurrency simulation systems—environments where the challenge isn't just making the code work, but ensuring it runs flawlessly for hundreds of simultaneous users. I thrive on solving performance headaches. My routine involves architecting complex logic and, more importantly, hunting down bottlenecks. I have a proven track record of analyzing systems under stress to find ways to slash hardware consumption (CPU/RAM), turning resource-heavy infrastructures into lean, scalable solutions. Beyond the technical side, I have experience leading teams and defining roadmaps, ensuring that technical delivery stays aligned with business goals.- Deep knowledge of building logic for real-time environments with high user density.- Real-world experience in reducing operational costs and latency through intelligent refactoring.- While my heart is in the Back-end, I am fully autonomous in React and Vue.js, allowing me to integrate modern interfaces into the core system without missing a beat.- Solid experience with MySQL/MariaDB, server monitoring, and end-to-end software architecture.

Experience

WinsVue

Back-end Developer

August 2025 - April 2026 (9 months)

I worked on the development and maintenance of high-complexity ecosystems for real-time simulation systems (Roleplay) with high user concurrency.

My primary focus was ensuring the stability and scalability of dynamic virtual environments, effectively balancing the delivery of new features with infrastructure health.

- Designed and implemented robust systems using Lua, TypeScript, and JavaScript, focusing on back-end logic for real-time data processing and complex state persistence.
- Led refactoring initiatives that resulted in drastic reductions in CPU and memory consumption across several critical systems, significantly enhancing user experience fluidity and reducing operational costs.
- Actively contributed to technical decision-making and system planning, leveraging an analytical mindset to anticipate bottlenecks and define efficient software architectures.
- Developed back-end solutions integrated with reactive interfaces in React and Vue.js, ensuring high-performance and intuitive communication between the server core and the front-end.
- Implemented server monitoring and diagnostic routines, providing agile resolution for complex issues and ensuring high environment availability under heavy load.
- Partnered on the update roadmap, translating community needs into sustainable, innovative, and user-centric technical solutions.

Energy

Software Developer

August 2022 - June 2025 (2 years 11 months)

I led the management of a back-end development team, distributing roles, defining objectives, and ensuring product quality.

I worked as a back-end developer focused on implementing new functionalities, system optimizations, and resolving operational issues.

I implemented new programming logic that resulted in more efficient code.

I restructured the operational part of the systems, creating a cleaner and more easily understandable workflow for the team.

Garty Group

Software Developer

January 2022 - March 2022 (3 months)

I played a role as a back-end developer for a company focused on FiveM.

I was responsible for implementing new functionalities, optimizations, and solutions for operational problems.

I provided support for 4 distinct servers, offering personalized solutions and functionalities that met the needs of each one.

Education

UniFavip Wyden+

Bachelor's, Science Computer · (January 2020 - December 2024)
